- **Belarusian State University, Bachelor's degree** 2018
- Psychologist. Psychology teacher

Courses

- **Test Planet** 2023
- Software testing basics

About me

I am a beginner QA Engineer with completed courses in software testing and a strong motivation to further develop my skills in this field.

During the Sowtware Testing Basics course, I worked on testing four projects (desktop and web). I gained practical experience in conducting Smoke testing, functional testing, non-functional testing, testing positive and negative scenarios, requirements testing, and writing test documentation (checklists, acceptance sheets, test surveys, quality reports) and logging defects in JIRA. I **successfully completed the final assignment** (Internship Application Form Testing), which involved writing test documentation, conducting functional and non-functional testing, and compiling a final report assessing the quality of the tested application. I am also familiar with test design techniques (equivalence class partitioning and boundary value analysis), project life cycle models (waterfall, V-model, iterative, Agile), and have knowledge of HTML/CSS and MySQL.

I believe that my strong communication and time management skills, organizational abilities, attention to detail, and analytical mindset will contribute to successfully fulfilling the responsibilities of a QA Engineer.

I am energetic and driven, eager to create and achieve new heights. I am ready to turn ideas into reality and contribute to the growth of your company alongside a team. I would be delighted to demonstrate my abilities and grow together with you.
